

# LTA Data Science X NTU EDGE

Chatbot Project

# Common Basic Chatbot Workings

# Internship Scope

## **Project Objectives**

- User question comprehension
- Knowledge base of chatbot represented in graphs
- Response generation
- Auto-generation of question intent topics

## **Mountains to Climb**

- Format questions to database searchable
- Structuring knowledge in graphs
- Returning human-like answers
- Flow & Intent recommendation/creation

# Decomposing Questions to Chatbot

(Annex A)

## Aligning questions to database searchable format

- Text normalisation
  - Out-of-vocabulary words, acronyms, contractions, emoticons, etc.
  - Localised English (Singlish), slangs, jargons
- 5W1H decompose to relation triplets <subject, predicate, object>
  - Mary (subj) had a (pred) little lamb (obj)
  - =< 2 of the 3 items will be extracted from the user's question to chatbot

# Knowledge Structure in Graphs

(Annex B)

## Training knowledge/fact extraction and representation

- Text normalisation
- Content summarisation
  - Extract salient topics/information

## Knowledge auto-structure, modelled after Open Knowledge Bases (DBPedia)

- Custom Entity-linkers to disambiguate polysemes
- Heuristic-dependency parser (?) into relation triplets

## Completeness of knowledge graph relationships

- Undiscovered relationships between nodes (subj/obj) and edges (pred)

# Natural Language Responses

(Annex C)

## Graph Traversal for Relevant Information

- Augmentation of original question – better search
  - i.e. What does the NATO military stand for?
  - *North Atlantic Treaty Organisation + Security Force + Member Countries + Strategic Military*
- Relevance of traversed path between nodes and edges
- Relevance to original question

## Translating structured inputs into natural languages

- Transform relevant relation triplet sets into human-sentences

# AI-assisted Dialogue Flow Creations

(Annex D)

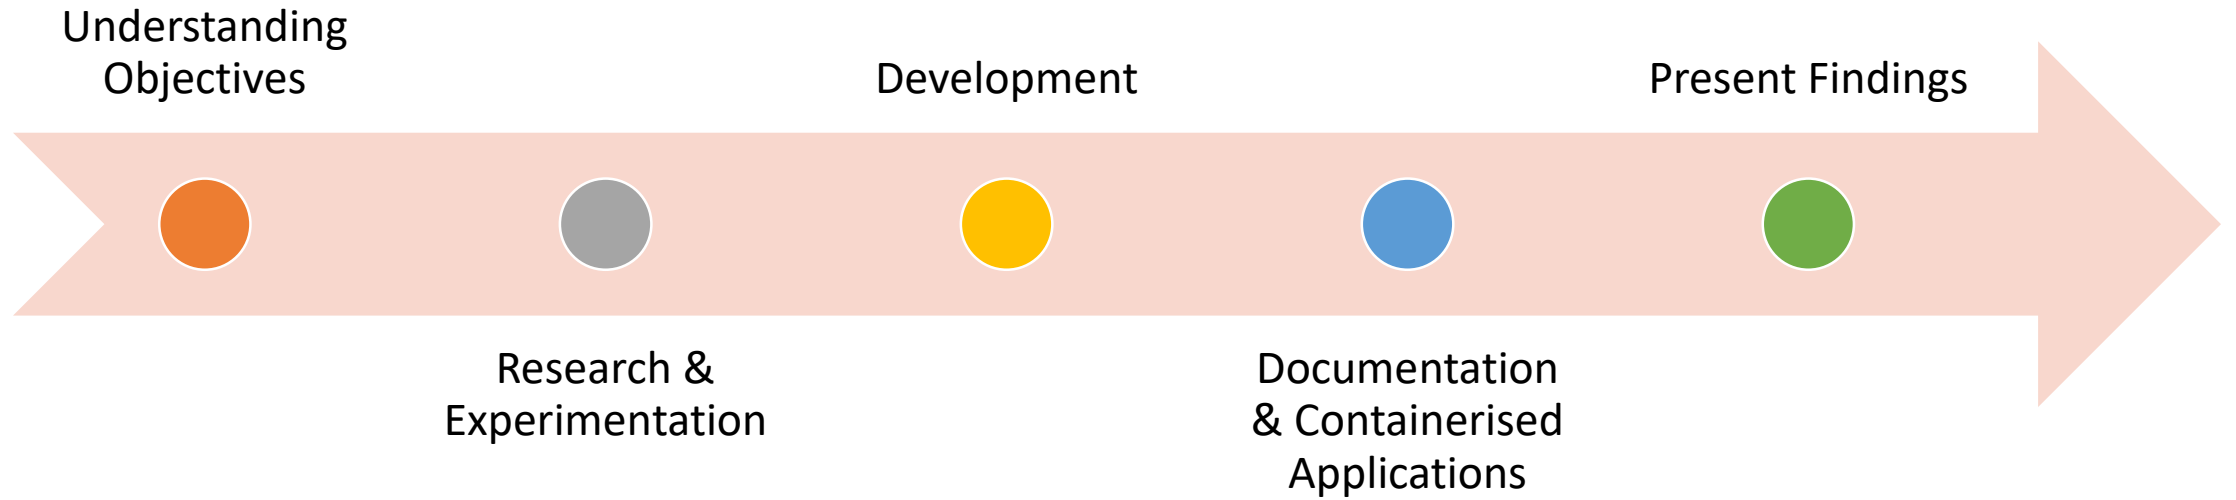

## Training Dataset Linked Topics

- Precedent Topic → Consequent Topic
  - (Conseq.) User request for computers
  - (Preced.) Enough funding? Obtain approval from?
- Grouping related training data sub-topics together to create flows

## Intent-chaining

- Question similarities
  - Possibly recommender systems - series of questions (topics)
  - Populate question-respond chains based on inferred “recommended questions”

# General Flow of Things

Thank You!

# Annexes

# Annex A: Question Decomposition

## Normalise localised Singlish to English

- Machine Translation
  - [Paper](#), project on translating Singapore SMS Singlish to proper English using MT
  - [C++ Tool](#), Moses MT tool used by paper
- Leverage word embedding to normalise words
  - [Python Tool](#), word-mover distance based on word embedding to find expanded word
  - [Paper](#), word-mover distance

## OOV word syntactic understanding

- [Paper](#), language model to infer dependencies/POS of words in sentences

## Heuristic information extraction

- [Web blog](#), overview of information extraction via spaCy

# Annex B: Knowledge Structuring

## Extractive & Abstractive Text Summarisation

- [Paper](#), text summarisation overview
- [Paper](#), unsupervised summarisation
- [Web Blog](#), text rank for extractive summary
- [Web Blog](#), sequence model with attention mechanism

## Knowledge relation & fact extraction

- [Web Blog](#), overview relation extraction
- [Paper](#), overview of tools for relation extraction

## Creating knowledge in graph

- [Paper](#), procedure to creating knowledge graph
- [Web Blog](#), heuristic fact extraction, creating knowledge graph

## Graph completion

- [Web Blog](#), graph embedding with Deep Walk
- [Web Blog](#), overview of graph completion algorithms, TransE/H/R/D
- [Paper](#), TransR
- [Paper](#), extends TransE models with Linear Programming

# Annex C: Question-Knowledge Match

# Annex D: Novel Dialogue-Flow Generation

## **Annex C**

### Knowledge retrieval

- [Paper](#), candidate ranking of relation units in graph DB

### Question-answer model

- [Web Blog](#), supervised SQuAD with bidirectional/attention sequence model

## **Annex D**

### Content clustering & visualisation

- [Paper](#), visualising LDA topics by relevance
- [Paper](#), visualise LDA topics
- [Python Tool](#), scikit-learn example on text clustering

### Recommender with Word Embedding

- [Web Blog](#), utilised method of training Word2Vec to recommend products

# Works beyond the horizon for thought...

## Classify type of question

- FAQ, transactional in nature or complex queries

## Master & slave bots

- Traffic direction chatbot vs. domain specific

## Forms in chatbot

- Receive inputs to make transactions: i.e. book appointment

## Sentiment detection

- Moderate responses into cordial mode when user exhibits frustration
